Perform a comprehensive bicycle accident fta

As a language model, I cannot perform an accident investigation or conduct a forensic traffic analysis (FTA) as it requires a physical examination of the accident scene and vehicles involved, collection of witness statements, and analysis of physical evidence. However, I can provide general information on the steps that are typically taken in a comprehensive bicycle accident FTA.

A comprehensive bicycle accident FTA typically involves the following steps:

1. Initial assessment: The first step is to assess the accident scene to ensure the safety of all involved parties and to identify any hazards or potential dangers. This includes checking for injuries and contacting emergency services if necessary.
2. Documentation: The next step is to document the accident scene and gather evidence. This may include taking photographs, measuring skid marks, collecting debris, and noting any other relevant details.
3. Witness statements: The next step is to gather statements from witnesses who may have seen the accident or have relevant information about it. This can help provide a clearer picture of what happened and who was at fault.
4. Investigation: The next step is to investigate the circumstances of the accident. This may involve reviewing police reports, medical records, and any other relevant documents, as well as interviewing the involved parties and witnesses.
5. Analysis: Once all the information has been gathered, the next step is to analyze the evidence to determine what caused the accident and who was at fault. This may involve consulting with experts such as accident reconstruction specialists or forensic engineers.

6. Report: The final step is to prepare a report summarizing the findings of the investigation. This report may be used in legal proceedings or to identify ways to prevent similar accidents from happening in the future.

It's important to note that the specific steps taken in a bicycle accident FTA may vary depending on the nature of the accident, the jurisdiction in which it occurred, and other factors. Additionally, an FTA is typically carried out by trained professionals, such as forensic engineers or accident reconstruction specialists.
